IASC 1P02 – Final Assignment Write-Up

The website that I have created is titled as Fate/Grand Order – The Final Assignment. It is a website that displays artworks drawing from different sources alongside edited versions with the knowledge that I have drawn from this class during this semester. In terms of colour design; dark grays, blues and whites dominates this website as it should feel cold and desolate as well as the transitioning to the other 2 html pages. Other colours, i.e. reds, green and yellows, within the HTML pages have been minimized in order to continue this feeling.

The navigation bar is set on the left side of the page in a fixed position therefore it should always be of assistance to the user. Considering that I did the minimum amount of HTML pages and having 3 links, I added a fourth link that take the user to a reference wiki page that is popular among Fate/Grand Order players. With the navigation bar placed on the left, the content must not interfere or be located where the navigation bar is placed and thus, I placed in a div that contains all content so that it does not interfere with the menu bar.

I decided that using a parallax while scrolling would be interesting to use and so it is used throughout all the pages in some shape or form. For the main page, the image of the sky along with the title scrolls slower than the rest of the content making it feel further than rest of the content. The three-character portraits all have the parallax to add a little life to them rather than being static images. Each character is given a slide box with 3 must famous used phrases that related to those specific character.

For the second page titled, Top 3, is a character showcase page. Considering that there are over 100+ character, I have chosen my top 3 in terms of visuals and game play and displayed them using JavaScript. As mentioned before the main colours that been used are blues, whites and dark grays for the same exact reasoning. There are tabs that to allow the user to view each character individually. The page is split into 3 sections; the large image, the tabs, and the title with small description. Selecting the characters tab would allow the contents on the page to change.

For the last page, it is a gallery that contains artworks from one of my favourite artists, WLOP. The page contains a select few artworks from this artist that are stored as thumbnails and brought up to a displaying block all using JavaScript. Just to also mention the thumbnails as well as the character select tabs from the second page also use a JavaScript and CSS function that allows grayscale to turn and off on hover and select. To top is all off there is a foot that is set on all pages that contains a JavaScript clock that displays EST, PST and JST as those are the prominent time zones.
